```
candorating a medical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the carrying out the methods of the carrying out the methods for the interference of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention (ADC313661-ADC32627) and the polypeptides encoded by the contigs (ADC32628 - ADC33394). The nucleic acids and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the useful in diagnostics, and polypeptides of the invention are captured of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and anino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, anaemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer. The nucleic acids may also be used as hybridisation probes or primares, and in the recombinant production of a proterion. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence of the invention note: The sequence of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, pain, neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

The invention discloses a composition comprising two or more isolated rate or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the movel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a chart issue of a first animal control is differentially expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the cativity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating compound that a pain an approach of the polypeptides given in the specification, a method for identifying a compound useful in treating compulates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for treating conjugates its activity is useful for preparing a medicament for the sequence data for this patent did not form part of the printed conjudication, but was obtained in electronic form directly from WIPO at the specification, but was obtained in electronic form directly from WIPO at the polyment in the pain and part peduces.

                                                                                    The invention provides a pharmaceutical composition containing ezrin protein, RNA or DNA mutated on tyrosine 353, or a functional fragment or derivative of the ezrin mutant. The new composition is useful for prevention and/or treatment of tumors, and especially metastasis. The present sequence represents the amino acid sequence of human ezrin (before the maturation by deletion of the first amino acid Met)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, diagnostic; drug screening; forensics; gene mapping; biodiversity assessment; Parkinson's disease; Alzheimer's disease; biodiversity assessment; Parkinson's disease; Alzheimer's disease; neurodegenerative disease; anaemia; platelet disorder; wound; burns; ulcers; osteoporosis; autoimmune disease; cancer; molecular weight marker; food supplement; antiparkinsonian; nootropic; neuroprotective; antianaemic; anticoagulant; thrombolytic; vulnerary; antiulcer; osteopathic; immunosuppressive; antiinflammatory; cytostatic; gene therapy; chromosome 6q25.2-26.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention, the
               New composition for prevention and treatment of tumors and metastasis.
                                                                                                                                                                                                                                                                                       Gaps

WPI; 2001-611725/70.

Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy.

New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or

cancer.

```
The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated at altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberran expression or physiological interactions of the polypeptide. Vectors comprising the considerable enough months to polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins of considerable ments. They may be used to increase stem cell proliferation, to regulate haematopoiesis, and in bone, cartilage, tendon and training as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human are also useful to invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   o

The invention relates to 91 novel numen curva sequences (ADC2919-4) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99% identical with the novel numen cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an entibody against a polypeptide of the invention is methods of invention in the complex of the invention; and methods of invention further discloses methods of peventing, tracting or numerical condition; kits comprising polynucleotide probes and/or monoclonal antibodies for carrying out the methods of the invention; methods for the polynucleotide and/or monoclonal antibodies for carrying out the methods of the invention in the invention; methods for the polynucleotide and/or polypeptide of the invention are corresponding to the compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767 conting sequences corresponding to the compounds that modulate the invention; methods for the polynucleotide and/or polypeptide; and 767 conting sequences corresponding to the confice of the invention are useful in diagnostics, dury screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other tratis, for assessing biodiversity, and animo acid sequences. They are also used for treating diseases such as Parkinson's glasses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           disorders, wounds, burns, ulcers, osteoporosis, autolimmine diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a specifically claimed human polypeptide sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; colon cancer; colon cancer antigen; diagnosis; detection; identification; cytostatic; cardioactive; neuroprotective, vulnerary; immunomodulatory; muscular; gynaecological; gastrointestinal; nephrotropic; antiinfective; antibacterial; gene therapy; wound; neural disorder; immune system disorder; muscular disorder; reproductive disorder; gastrointestinal disorder; infectious disease; cardiovascular disorder; renal disorder;

AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, wounds, renal disorders, reproductive disorders, immune system cardiovascular disorders, reproductive disorders, and cardiovascular disorders, infectious diseases, and cardiovascular disorders, AAC98764 to AAC98772 and AAB54007 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, hepreceptor domain B, cytostatic, anti-HIV, antibictic; nootropic; immune response inducer; ezrin; infectious diseases; cancer;

polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or
                                             Novel regulatory or unfolding peptides of ezrin that binds to
Hepreceptor, useful for inducing immune response for treating infectious
diseases and cancer.
                                                                                                                                                   The present sequence is domain B of human hepreceptor of human ezrin. The hepreceptor is a novel active site in human ezrin. Ezrin regulates the structure of the cortical cytoskeleron to control cell surface topography. The present invention relates to peptides (see AAB82041) that bind to hepreceptor with greater affinity than HEP1 (see AAB82046). The hepreceptor binding peptides are useful for inducing immune response, and for treating infectious diseases, cancer and HIV-related dementia. The present sequence assembles into two anti-parallel helices with hepreceptor domain A (see AAB82019)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    acids encoding a range of human polypeptides, useful in genetic ion, testing and therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, vaccination; gene therapy; nutritional supplement;
stem cell proliferation; haematopoiesis; nerve tissue regeneration;
immune suppression; immune stimulation; anti-inflammatory; leukaemia.

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, delivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence subjected to pain, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a
physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically engineered to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bone, cartilage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypetides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating complete its activity is useful for preparing a medicament for treating in pain (e.g. spinal segmental nerve injury (NII)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification) but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent

The invention relates to a novel method for identifying a compound that modulates T lymphocyte activation. The method comprises contacting a T cell comprising an A-raf-1 or TCPTP/PTNZ polypeptide with a compound, where the A-raf-1 or TCPTP/PTNZ polypeptide is encoded by a nucleic acid that hybridises to a nucleic acid encoding a polypeptide having a sequence selected from two 606-amino acid sequence and a 415-amino acid sequence eslected from two 606-amino acid sequence and a 415-amino acid sequence selected from two 606-amino. The method of the invention has immunosuppressive, antiasthmatic, antiallergic, and antiinflammatory activity. The method is useful for identifying compounds that modulate lymphocyte activation and migration, and for monitoring changes in cell surface marker expression, cytokine production, antibody production, con primary cells. The A-raf-1 or TCPPP/PTNZ proteins may be used as crivation and migration, e.g. for the treatment of diseases in which modulation of the immune response is desired such as delayed type compounds that suppress or activate lymphocyte activation and migration, e.g. for the treatment of diseases in which modulation of the immune response is desired such as delayed type confluence and chronic inflammation. Modulators of lymphocyte activation and acute and chronic inflammation. Modulators of lymphocyte activation and migration is asthma allergies, graft versus host disease, and acute and chronic inflammation. Modulators of lymphocyte activation and migration and disconders related T and B cell activation and inflammation. The present sequence is used in the exemplification of the

Diagnosing cancer cells in tissue sample, or determining prognosis or outcome of cancer patient, by calculating ratio of expression levels of genes that are differentially expressed in cancer and non cancer tissues.

New nucleic acid useful for diagnosing, preventing or treating diseases associated with aberrant vascular activity, angiogenesis, vasculogenesis and cartilage or bone formation, e.g. atherosclerosis or diabetes.

WPI; 2003-731500/69. N-PSDB; ADC77530, ADC77531.

The present invention describes an isolated nucleic acid (I) comprising:

Claim 25; SEQ ID NO 27; 70pp; English

The present invention describes a method (M1) for diagnosing the presence

```
the prognosis or non-cancer cells in a tissue sample, or determining the prognosis or outcome of a cancer patient. M1 involves providing a set of genes that are differentially expressed in cancerous or non-cancerous conditions, determining the expression levels of the set of genes and calculating a ratio of the expression levels of the differentially expressed genes. M1 is useful for diagnosing the presence of cancer cells or non-cancer cells in a tissue sample, where the cancer is malignant pleural mesotheliona (MPM), lung adenocarcinoma, squamous carcinoma, medulloblastoma, prostate cancer, breast cancer, diffuse large B-cell prognosis or outcome of a cancer patient. The ratio of expression levels of differentially expressed genes is used as an indicator of cancer type, cancer class, and/or cancer prognosis, all of which are useful for determining a course of treatment of a patient. The present sequence represents a human protein which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           hybridisation, testicular tumour differentially expressed gene 1, TDE1, patchy vessel, PTV, HLA class II region expressed gene 4, HKE4, vascular endothelial growth factor; VGGF, antirheumatic; antiarthritic; antiarteriosclerotic; antiabetic; ophthalmological; antipsoriatic; cytostatic; osteopathic; antiangiogenic; antisense gene therapy; aberrant vascular activity disorder; andiogenesis; vasculogenesis; carrilage formation disorder; bone formation disorder; rheumatoid arthritis; atherosclerosis; diabetes; retinopathies;

the problem of that hybridises under stringent conditions to a hybridisation probe comprising a sequence of 1422 (human (testicular) tumour differentially expressed gene I (TDEI) encoding CDNA ADC77521).

786 (human patchy vessels (FTV) encoding CDNA ADC77521) or 1410 (human patchy vessels (FTV) encoding CDNA ADC77531) base gairs (bp), or its complement; or (b) a sequence that is 90% identical to the probe sequences or their complements. Also described: (1) a composition comprising: (a) an isolated polypeptide comprising a sequence composition comprising: (a) an isolated polypeptide comprising a sequence composition comprising: (a) an isolated polypeptide comprising a sequence composition comprising: (b) a combination of a pharmaceutical captains and TDEI, PTV and HER4, or (b) a combination of a pharmaceutical carrier, vascular endothelial growth factor (VEGF) and TDEI or PTV; (2) an antisense polymucleic acid comprising a sequence, where the antisense polymucleic acid suppresses the expression of a human, mouse or zebrafish TDEI, PTV or HER4; and (3) a teleost comprising the antisense polymucleic acid suppresses the expression of a human, mouse or zebrafish TDEI, PTV or HER4; and (3) a teleost comprising the antisense polymucleic anticiabetic, ophthalmological, antisporiatic, cytostatic, osteopathic and antispotence acid (1) and polypeptide encoded by it, can be used for research, diagnostics, prophylaxis and therapeutic use. They may be used for research, diagnostics, prophylaxis and therapeutic use. They may be used for research, diagnostics, prophylaxis and therapeutic use. They may be used for research, diagnostics, prophylaxis wasculase associated with aberrant commutation. The diseases may include rheumatoid arthitis, at atherapeutic atherapeut invention.

The diseases may include rheumatoid arthitis or cancer. The atherasculase to a preventing or tethoresents returned by a career invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 577 AA;

Lankes W.T., Furthmayr H.;
"Mosein: a member of the protein 4.1-talin-ezrin family of proteins.";
Proc. Natl. Acad. Sci. U.S.A. 88:8297-8301(1991).
                                                                                                                 Goldenring J.R.;
Submitted (AUG-2002) to the EMBL/GenBank/DDBJ databases.
-!-FUNCTION: Probably involved in connections of major cytoskeletal structures to the plasma membrane (By similarity).
-!-SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
-!-FTM: Phosphorylated by tyrosine-protein kinases (By similarity).
-!-SIMILARITY: Contains 1 FERM domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

-!- FUNCTION: Probably plays a crucial role in the binding of the bankTION: Probably plays a crucial role in the binding of the barbed end of actin filaments to the plasma membrane.

-!- SUBCELLULAR LOCATION: HIGHLY CONCENTRATED IN THE UNDERCOAT OF CELL-TO-CELL ADHERENS JUNCTION AND THE CLEAVAGE FURROW IN THE INTERPRENARE AND MITOTIC PRASE, RESPECTIVELY.

-!- PTM: Phosphorylated by tyrosine-protein Kinases.

-!- PTM: Contains I FERM domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PRINTS; PR00935; BAND41.

Proc. Natl. Acad. Sci. U.S.A. 99:16899-16893 (2002).

-!- FUNCTION: Probably plays a crucial role in the binding of the barbed end of actin filaments to the plasma membrane.

-!- SUBCELLULAR LOCATION: HIGHLY CONCENTRATED IN THE UNDERCOAT OF THE CELL-TO-CELL ADDERENS UNCTTON AND THE CLEAVAGE FURROW IN THE INTERPHASE AND MITOTIC PHASE, RESPECTIVELY.

-!- PTM: Phosphorylared by tyrosine-protein kinases (By similarity).

-!- SIMILARITY: Contains 1 FERM domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Submitted (DEC-1992) to the EMBL/GenBank/DDBJ databases.
Submitted (DEC-1992) to the EMBL/GenBank/DDBJ databases.
FUNCTION: Intermediate filament-associated protein that associates in regular arrays with keratin intermediate filaments (KIF) of the inner root sheath cells of the hair folliole and the granular layer of the epidermis. It later becomes cross-linked to KIF by isodipeptide bonds. It may serve as scaffold protein, together with involucrin, in the organization of the cell envelope or even anchor the cell envelope to the KIF network. It may be involved in its own calcium-dependent postsynthetic processing during terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -i- TISSUE SPECIFICITY: Found in the hard keratinizing tissues such as the inner root sheath (IRS) of hair follicles and medulla, and in the filliform papillae of dorsal tongue epithelium (Probable).
-i- DEVELOPMENTAL STAGE: Expressed during late differentiation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DOMAIN: Consists of nine domains. Domain 1 contains two EP-hand calcium-binding domains. Domains 2-4, 6, and 8 are almost entirely
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oryctolagus cuniculus (Rabbit).

alpha-helical, configured as a series of peptide repeats of varying regularity, and are thought to form a single-stranded alpha-helical rod stabilized by ionic interactions. Domain 6 is the most regular and may bind KIF directly by ionic interactions. Domains 5 and 7 are less well organized and may induce folds in the molecule. Domain 9 contains the C-terminus, conserved among
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0; Gaps

J. Cell Biol. Intermediate filament-associated protein that associates in regular arrays with keratin intermediate filaments (KIF) of the inner root sheath cells of the hair follicle and the granular layer of the epidermis. It later becomes cross-linked to KIF by isodipeptide bonds. It may serve as scaffold protein, together with involucrin, in the organization of the cell envelope or even anchor the cell envelope to the KIF network. It may be involved in its own calcium-dependent postsynthetic processing during terminal

ISOSUE SPECIFICITY: Found in the hard keratinizing tissues such as the inner root sheath (IRS) of hair follicles and medulla, and in the pitchelia of the torgue, hoof and rumen.

DOMAIN: Consists of nine domains. Domain 1 contains two EF-hand calcium-binding domains. Domains 2.4, 6, and 8 are almost entirely alpha-helical, configured as series of peptide repeats of varying regularity, and are thought to form a single-stranded alpha-helical rod stabilized by ionic interactions. Domain 6 is the most regular and may bind KIF directly by ionic interactions. Domain 6 is commans 5 and 7 are less well organized and may induce folds in the molecule. Domain 9 contains the C-terminus, conserved among
differentiation marker in the hair follicle, contains a 23 amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           probably converted to cirullines by peptidylarginine deimidase. SIMILARITY: In the N-terminal section; belongs to the S-100

FUNCTION: Intermediate filament associated protein that associates in regular arrays with keratin intermediate filaments (KIF) of the inner root sheath cells of the hair follicle and the granular layer of the epidermis. It later becomes cross-linked to KIF by isodipeptide bonds. It may serve as scaffold protein, together with involucrin, in the organization of the cell envelope or even anchor the cell envelope to the KIF network. It may be involved in its own calcium-dependent postsynthetic processing during terminal
                                                                                                                                                                                                                                                                                     the epidermis.

-i- DOWAIN: Consists of nine domains. Domain 1 contains two EF-hand calcium-binding domains. Domains 2-4, 6, and 8 are almost entirely alpha-helical, configured as a series of peptide repeats of varying regularity, and are thought to form a single-stranded alpha-helical rod stabilized by ionic interactions. Domain 6 is the most regular and may bind KIF directly by ionic interactions. Domains 5 and 7 are less well organized and may induce folds in the molecule. Domain 9 contains the C-terminus, conserved among
